**Main Point:** The P, NP, NPC and NPH classes are used to know the analysis of the time complexity of an algorithm. These classes give us a common vocabulary for people to talk with different technical. These different complexity classes represent different knowledge.

**SCI Point:** Knowledge is different in different level of consciousness.

**Connection with SCI:** Each of the complexity classes gives us knowledge about the algorithm. For example if we design an algorithm which runs in polynomial time, then it is the member in P algorithm. Again if an algorithm runs in exponential time, it is the member in NP algorithm. So the people who design algorithm can communicate in higher level using P, NP, NPC and NPH. So It make easy to understand the algorithm among the people what I mean.

From SCI, we know human being has seven conscious states. Waking, Sleeping, Dreaming, Transcendental, Cosmic, God Realization and Unity state. And different state has different characteristics. The Knowledge is different in those states. In waking, sleeping or dreaming state knowledge is different. Again in unity we will find connection with our self to others. Therefore consciousness is the home of knowledge.

So we know knowledge is different in different consciousness, and algorithm in different complexity classes represent different knowledge.
